Quick Start Guide :

Creating a backup for OpsPro files (A.K.A. "Backup Your Setup")

This step-by-step guide can be used to backup the user's OpsPro files, allowing for testing of various ideas and methods for moving cars in a desired fashion. This will establish a default version of the user's overall setup, which can be restored in the event of things getting "sideways" while testing out the ideas. Use this quick-start after inputting any Locations, all those Cars, and perhaps Routes and Trains.

Step-by-step "How-To":

1. If **PanelPro** is not already open, then open **PanelPro**.
2. Select "**Operations**--->**Settings"** from the main menu.
    a. Click on "Backup" at the bottom center.
    b. Type in a memorable name (like "ABC RR_Default" or "MyABC RR").
3. Close the **Settings** window.
4. Close **PanelPro**, or continue to develop other OpsPro sections.

Upon completion of this task, the time spent inputting all the data should not have to be repeated. Also, any further changes made by the user may be overwritten by using this How-To guide again, using the same memorable name as before. Or save new versions (tests or permanent) with different names.

Note: All these quick-start guides are intended for use with OpsPro, a stand-alone app accessed from within PanelPro. No other PanelPro functions need be used if so preferred.
