Quick Start Guide :

Adding a new JMRI Profile (perhaps for testing other OpsPro set-ups)

This step-by-step guide will allow the user to create a new profile for **PanelPro**. This might be helpful for testing new set-ups for different applications within the main **PanelPro** menu, like control panels, scripts, automatic train control, or operations. WARNING: This will effectively reset the user's OpsPro to start up, meaning re-entering all files (including cars). A better option may be to use the "Backup" feature found at the bottom of the **Operations--->Settings** window (see the "How-To" guide for "Backup Your Setup").

Step-by-step "How-To":

1. Open **PanelPro**.
2. This should open a window entitled "Set Active Profile".
3. Click on "New".
   a. Create a profile name.
   b. Click "OK".
4. Select the new profile just created.
   a. Click "OK".
5. This will launch the **Preferences** window.
   a. Click "Save" at lower left.
6. Quit **PanelPro.**
7. Re-start **PanelPro**. (Note: review "How-To #001" to add "Operations" to main **PanelPro** menu)

Upon completion of this task, the user will be able to select which profile to use at the start-up of **PanelPro**. This will allow for testing/experimenting of different settings without losing other work already saved, and, for OpsPro users, more easily switch between databases. Remember, a new profile will create a "clean slate" for how to build "operations" on the layout.

Note: All these quick-start guides are intended for use with OpsPro, a stand-alone app accessed from within PanelPro. No other PanelPro functions need be used if so preferred.
